

GUI-TRADE-CHART-1a — Plan-Review

Datum: 2026-05-15 14:19 UTC | Repo: Steve-TradingBot | master HEAD: fa7e450 (GUI-TRADE-EXPORT-1-FU1) | Modus: EXCHANGE_TESTNET
| Scope: **READ-ONLY** | Implementation: **NO-GO (Vorphasen)**

Executive Summary

Ziel: Trade-Detail-Tab mit OHLCV-Candles, Entry/Exit-Markers, SL/TP-Step-Lines, Trailing-Path und Decision-Attribution — Operator-Self-Review-Tool, kein Trading-Interface.

Architektur-Entscheidung: 5 Phasen über ~4 Wochen. **GUI-TRADE-CHART-1b** (Basic-Chart) ist **NICHT** sofort umsetzbar — beide Voraussetzungen **OHLCV-CACHE-1** + **TRAIL-EVENT-LOG-1** brauchen DB-Migration und müssen vor 1b laufen.

Operator-Decisions Q1-Q8 alle bestätigt → verbindlicher Implementation-Pfad. **Migration-Impact: 2 neue Tabellen** (ohlcv_cache + trade_events) plus 1 Frontend-Dep (lightweight-charts npm).

0. API/Tool-Abhängigkeiten — Operator-Input erforderlich?

Kurzantwort: NEIN — keine externen API-Keys oder Subscriptions vom Operator nötig. Ich beschaffe alle benötigten Tools/Libraries selbst.

| Komponente | Quelle | API-Key nötig? | Wer beschafft |
|---------------------------|--|-------------------------------|---|
| OHLCV-Daten (Candles) | Binance Public Klines API /api/v3/klines | NEIN (public endpoint) | Backend nutzt bestehende ccxt -Library (im Bot bereits aktiv für scanner/regime.py) |
| Chart-Library | TradingView lightweight-charts (Apache-2.0) | NEIN | npm install lightweight-charts im GUI-Build, kostenlos, kein Account |
| Rate-Limit Binance public | 1200 weight/min, klines=1 weight | — | 56 Trades × ~1 fetch = unkritisch. Cache vermeidet repeated fetches |
| TradingView Account/Sub | — | NEIN | Lightweight Charts ist standalone — keine Verbindung zu TradingView-Servern |
| BINANCE_API_KEY/SECRET | bereits in .env für Testnet-Order-Execution | nicht für Chart | Existiert schon, wird NICHT für OHLCV-Cache verwendet (public endpoint) |

Einzige Operator-Decision (optional): Mainnet-Candles vs. Testnet-Candles für Chart.

- **Mainnet public klines:** echte Preise, höhere Liquidität, semantisch realistisch (Bot trade auf Testnet, aber Preise sind ähnlich)

- **Testnet public klines:** matched 1:1 zu Bot-Orders, aber Testnet-Preise sind oft thin/synthetic

Empfehlung: Mainnet-Klines (default Binance ccxt-config), weil sie die *echten* Market-Bewegungen zeigen, die zum Trade führten. Operator-Override möglich.

1. Live-State Preflight

| Item | Wert |
|---|--|
| master HEAD | fa7e450 (GUI-TRADE-EXPORT-1-FU1) |
| Bot host-PID | 1228771 healthy |
| BINANCE_TESTNET | true |
| LABEL-1 / DATA-LINK-1 / DATA-CLEANUP-1 / SOT-1d / GUI-DESIGN-1a | alle live |
| Frontend Stack | Filament 5, Tailwind 4, Vite 6, Laravel 13 |
| Chart-Library | nicht installiert |
| routes/web.php | nur redirect('/', '/admin') — eigener Route-Slot frei |
| OHLCV-Cache-Tabelle | existiert nicht |
| trade_events-Tabelle | existiert nicht |
| logs/sl_adjustments.json | 1.5 MB, 75 Symbole , Format {time, kind, old_sl, new_sl, sl_changed, old_tp, new_tp, tp_changed, reason} — Legacy-Bridge für Backfill |

2. Architektur — Current vs Target

```
CURRENT
trade_logs (56 rows) —
decision_logs — (DATA-LINK-1: decision_id JOIN für neue Trades)
position_snapshots —
sl_adjustments.json — JSON, 1.5MB, symbol-scoped, NICHT in DB

OHLCV — ccxt fetch_ohlcv (ephemer, nicht persistiert)
trading/scanner/universe.py
trading/scanner/regime.py
```

3. Operator-Decisions Q1-Q8 (verbindlich)

| ID | Entscheidung | Implikation |
|----|---|--|
| Q1 | OHLCV: DB-backed ohlcv_cache | Postgres-Migration nötig, joinbar mit trade_logs |
| Q2 | Dedicated JSON-Route /admin/trades/{id}/chart-payload hinter Filament/Auth | Route: :get in web.php, eigener Controller, Filament-Middleware-Stack |
| Q3 | trade_logs.id für closed, + position_id für open Positions | Controller akzeptiert beide ID-Typen, Resolver entscheidet |
| Q4 | Neue trade_events -Tabelle | Migration nötig, strukturiertes Event-Stream-Model |
| Q5 | Sub-Marker unter einem Trade, kein parent_trade_id jetzt | DCA/Pyramid-Adds = event_type='dca_add' / 'pyramid_add' in trade_events, gleicher trade_id |
| Q6 | "Replay limited"-Banner für Legacy, Tab nutzbar | Controller liefert payload.replay_limitations[], Frontend rendert Banner |
| Q7 | Adaptive Timeframe (1m/5m/15m/1h je Hold-Time) | Backend wählt timeframe basierend auf closed_at - opened_at |
| Q8 | Gemeinsame OHLCV/Event-Basis für Chart UND Backtest | Wiederverwendbarer Service-Layer (OHLCVCacheService + TradeEventService) |

4. Daten-Verträge

4.1 ohlcv_cache — NEU (OHLCV-CACHE-1 Migration)

```

CREATE TABLE ohlcv_cache (
  id          BIGSERIAL PRIMARY KEY,
  symbol      VARCHAR(50)  NOT NULL,
  timeframe   VARCHAR(10)  NOT NULL, -- '1m'|'5m'|'15m'|'1h'|'1d'
  open_time   BIGINT       NOT NULL, -- UNIX ms epoch (Binance-kline)
  close_time  BIGINT       NOT NULL,
  open        NUMERIC(20,8) NOT NULL,
  high        NUMERIC(20,8) NOT NULL,
  low         NUMERIC(20,8) NOT NULL,
  close       NUMERIC(20,8) NOT NULL,
  volume      NUMERIC(24,8) NOT NULL,
  fetched_at  TIMESTAMPTZ NOT NULL DEFAULT NOW(),
  UNIQUE (symbol, timeframe, open_time)
);
CREATE INDEX ohlcv_cache_symbol_tf_time ON ohlcv_cache (symbol, timeframe, open_time DESC);

```

4.2 trade_events — NEU (TRAIL-EVENT-LOG-1 Migration)

```

CREATE TABLE trade_events (
  id          BIGSERIAL PRIMARY KEY,
  trade_id    VARCHAR(255),          -- nullable (open positions noch ohne trade_id)
  position_id VARCHAR(255),          -- T-SPLIT-2/N8.2 stabile ID
  symbol      VARCHAR(50)  NOT NULL,
  event_time  TIMESTAMP(6) WITH TIME ZONE NOT NULL,
  event_type  VARCHAR(50)  NOT NULL,
  price       NUMERIC(18,8),
  qty         NUMERIC(24,12),
  old_sl, new_sl NUMERIC(18,8),
  old_tp, new_tp NUMERIC(18,8),
  sl_kind     VARCHAR(50),          -- LABEL-1 subtype
  tp_kind     VARCHAR(50),
  pnl         NUMERIC(18,6),
  reason      VARCHAR(255),
  metadata    JSONB,
  created_at  TIMESTAMPTZ NOT NULL DEFAULT NOW()
);
CREATE INDEX trade_events_trade_id ON trade_events (trade_id);
CREATE INDEX trade_events_position_id ON trade_events (position_id);
CREATE INDEX trade_events_symbol_time ON trade_events (symbol, event_time DESC);

```

4.3 Event-Types & Hook-Stellen im Bot

| event_type | Bot-Quelle |
|-------------------|---|
| entry | paper_trade.py:execute_buy (allow_add=False) |
| exit | paper_trade.py:execute_sell · inkl. LABEL-1 exit_reason |
| stop_loss_set | paper_trade.py:execute_buy init |
| take_profit_set | paper_trade.py:execute_buy init |
| trailing_update | position_manager.py:apply_trailing() |
| break_even_update | position_manager.py:apply_breakeven() 60h |
| dca_add | execute_buy(allow_add=True) DCA-Branch |
| pyramid_add | execute_buy(allow_add=True) Pyramid-Branch |
| news_tightening | position_manager.py:apply_news_adjustment() BEARISH |

4.4 Legacy-Backfill (optional)

logs/sl_adjustments.json enthält bereits 75 Symbole × n Events im Format {time, kind, old_sl, new_sl, sl_changed, old_tp, new_tp, tp_changed, reason}. kind ist eines von trailing / breakeven / news / hard_exit. Eine einmalige Backfill-Migration könnte historische Adjustments retroaktiv in trade_events schreiben — aber symbol-scoped, Mapping zu trade_id ist heuristisch (time-range JOIN).

Empfehlung: optional, niedrige Priorität.

4.5 Chart-Payload-Format

```
{
  "trade": { "id", "symbol", "entry_price", "exit_price", "opened_at",
            "closed_at", "realized_pnl", "exit_reason", "decision_id" },
  "decision": { "score", "regime", "source", "strategy_id" },
  "candles": [ { "time", "open", "high", "low", "close", "volume" } ],
  "events": [ { "type", "time", "price", "old_sl", "new_sl", "reason" } ],
  "replay_limitations": [ "no_trail_events_pre_TRAIL_EVENT_LOG", "decision_link_missing" ],
  "meta": { "timeframe", "candles_from", "candles_to", "is_legacy" }
}
```

5. Phasen-Plan

| Phase | Inhalt | Aufwand | DB-Mig. | Risiko |
|---------------------------------------|---|---------|---------|------------|
| GUI-TRADE-CHART-1a | Plan-Review (dieser) | DONE | nein | — |
| OHLCV-CACHE-1 | ohlcv_cache -Tabelle + Migration + OHLCVCacheService + Binance public-klines fetch + adaptive-tf-Resolver | ~8-12h | ja | Medium |
| TRAIL-EVENT-LOG-1 | trade_events -Tabelle + Migration + Hook-Insert in paper_trade/live_trade/position_manager (additiv, kein behaviour change) | ~10-15h | ja | Medium |
| TRAIL-EVENT-LOG-1-BACKFILL (optional) | sl_adjustments.json retroaktiv mapping zu trade_id | ~3-5h | nein | niedrig |
| GUI-TRADE-CHART-1b | TradeChartController + JSON-Route + lightweight-charts npm + Vite-bundle + Basic Chart (Candles + entry/exit + Summary) | ~12-15h | nein | Low-Medium |
| GUI-TRADE-CHART-1c | Advanced Overlays — SL/TP-Step-Lines + trailing path + DCA/Pyramid-Marker + Timeline-Tab | ~6-10h | nein | Medium |
| GUI-TRADE-CHART-1d | Decision/Risk-Panel (regime/score/source/strategy_id aus DATA-LINK-1) | ~4-6h | nein | Low |

Gesamt: ~43-63 h Code + 2 Migrationen.

6. Frontend-Integration

- npm install lightweight-charts (~50 KB minified, Apache-2.0) → resources/js/trade-chart.js als isoliertes Bundle
- vite.config.js Input erweitern: 'resources/js/trade-chart.js'
- AdminPanelProvider unverändert — Route registriert via routes/web.php
- Filament-Blade-View bekommt <x-stb.trade-chart :trade-id="\$record->id" /> Component, lädt JSON via fetch() vom Endpoint, mountet Chart in <div> -Container
- CSP-konform: kein inline-Script, nur data-* -Attribute auf Container

7. Backend-Pattern

```
// routes/web.php
Route::middleware(['auth', 'verified'])
    ->get('/admin/trades/{trade}/chart-payload', [TradeChartController::class, 'show']);

App\Services\TradeChart\
├─ TradeChartPayloadBuilder // composer: trade + decision + candles + events
├─ OHLCVCacheService // fetch + insert + read (Binance public klines via ccxt)
├─ TradeEventQuery // filter + join trade_id/position_id
├─ AdaptiveTimeframeResolver // Q7: hold-time → timeframe
```

Authorization: TradeChartController ruft TradeLogResource::canAccess() (Admin-only, GUI-TRADE-EXPORT-1). 403 wenn nicht Admin.

8. Bot-Code-Hooks (TRAIL-EVENT-LOG-1)

| File:Stelle | Hook | events |
|---|--|--------|
| paper_trade.py:execute_buy nach_new_pos | INSERT entry + stop_loss_set + take_profit_set | 3 |
| paper_trade.py:execute_sell nach trade_record | INSERT exit | 1 |
| paper_trade.py:update_prices DCA-Rescue | INSERT dca_add | 1 |
| position_manager.py:apply_trailing | INSERT trailing_update | 1 |
| position_manager.py:apply_breakeven 60h | INSERT break_even_update | 1 |
| position_manager.py:apply_breakeven 96h-Hard-Exit | INSERT trailing_update reason=hard_exit_96h | 1 |
| position_manager.py:apply_news_adjustment | INSERT news_tightening | 1 |

Pattern: DB-Write via db_emitter.py Pattern — neue Function emit_trade_event() analog emit_trade / emit_decision . **Additiv**, kein Verhalten geändert.

9. Adaptive Timeframe (Q7)

| Hold-Time | Timeframe | ~Candles |
|--------------------|-----------|----------|
| < 1h | 1m | ~60 |
| 1-6h | 5m | ~72 |
| 6-24h | 15m | ~96 |
| 24-96h (Hard-Exit) | 1h | ~96 |
| > 96h | 1h | cap 200 |

Service: AdaptiveTimeframeResolver::resolve(\$openedAt, \$closedAt): string .

10. Read-only-Boundaries

| Boundary | Status |
|----------------------------------|---|
| Kein Live-Order vom Chart aus | ✓ nur GET |
| Kein Strategy-Param-Change | ✓ |
| Keine historische DB-Mutation | ✓ insert-only Tables |
| Keine synthetischen Trades | ✓ |
| Kein Mainnet (Order) | ✓ BINANCE_TESTNET=true gepinnt |
| Keine Secrets in Logs/Reports | ✓ AuditMetadataScrubber re-use |
| Keine Mockdaten | ✓ Empty-State → "replay_limited"-Banner |
| Kein TradingView-Buy/Sell-Action | ✓ Lightweight Charts hat keine Actions |

11. Akzeptanzkriterien

| Bereich | Kriterium |
|---------------|---|
| Basic chart | Candles um opened_at±buffer, entry/exit markers |
| Price labels | Exakte Werte aus trade_logs (nicht candle-approx) |
| Exit label | LABEL-1 Subtype |
| Decision link | regime/score/source IF decision_id; sonst "legacy/no decision link" |
| Trailing | Step-Lines IF events; sonst "trailing history unavailable" |
| OHLCV | Cached, nicht repeatedly fetched |
| Mobile | Horizontal-Scroll-Container, breaks GUI nicht |
| Security | Keine Secrets/env/trade-actions/Mainnet |

12. Risiko-Matrix

| Risiko | Schwere | Mitigation |
|--|-------------|--|
| 2 neue DB-Tabellen (Migration) | mittel | OHLCV-CACHE-1 + TRAIL-EVENT-LOG-1 jeweils eigener Migration-Plan-Review vor Code |
| Bot-Code-Touch in TRAIL-EVENT-LOG-1 (7 Insert-Hooks) | HOCH | Strikt additiv, kein behaviour change, Tests pro Hook, Build via SOT-1d-Pfad |
| OHLCV-Backfill für legacy trades | niedrig | Optional, kann nach 1b/1c |
| Lightweight-Charts JS-Library-Vertrauen | niedrig | tradingview/lightweight-charts: open source, Apache-2.0, >9k stars, vom TradingView selbst |
| Adaptive Timeframe bei sehr kurzen Trades (<5 min) | niedrig | Default 1m, falls Hold <5min: cap candles |
| Open Positions ohne exit-Event | niedrig | Frontend rendert "Position open" overlay statt exit-marker |
| Decision-Link für pre-DATA-LINK-1-Trades | niedrig | "Replay limited"-Banner + Tab grayed-out für decision panel |
| Mobile-Chart-UX | mittel | Lightweight Charts native-touch-support + stb-* mobile defenders aus FU3 |
| Backtest gemeinsame Datenbasis (Q8) | niedrig | Service-Layer-Pattern abstrahiert Datenquelle |

13. GO / NO-GO

| Phase | Status |
|-----------------------------------|---|
| GUI-TRADE-CHART-1a Plan-Review | DONE |
| GUI-TRADE-CHART-1b Implementation | NO-GO sofort — 2 Vorphasen nötig |

14. Empfohlene Sequenz

| Reihenfolge | Phase | Voraussetzung | Aufwand |
|-------------|--|------------------------------|----------|
| 1 | DATA-LINK-1-MONITOR Wartephase (passive, läuft schon) | — | 24-72 h |
| 2 | LABEL-1-MONITOR Wartephase (passive, läuft schon) | — | 3-5 d |
| 3 | OHLCV-CACHE-1 Plan-Review (Migration + Service) | — | ~1 h |
| 4 | OHLCV-CACHE-1 Impl | Plan-GO | ~8-12 h |
| 5 | TRAIL-EVENT-LOG-1 Plan-Review (Migration + Bot-Hooks) | — | ~1 h |
| 6 | TRAIL-EVENT-LOG-1 Impl + Backfill (optional) | Plan-GO | ~13-20 h |
| 7 | GUI-TRADE-CHART-1b Impl (Basic Chart) | OHLCV + TRAIL-EVENT live | ~12-15 h |
| 8 | GUI-TRADE-CHART-1c Impl (Advanced Overlays) | 1b live | ~6-10 h |
| 9 | GUI-TRADE-CHART-1d Impl (Decision/Risk) | 1c live + DATA-LINK-1 stabil | ~4-6 h |

15. Boundaries (Plan-Phase eingehalten)

| Boundary | Status |
|---------------------------|------------------------------|
| Kein Code | ✓ |
| Keine DB-Migration | ✓ |
| Keine Bot-/Worker-Restart | ✓ |
| Kein Mainnet | ✓ |
| Kein Push | ✓ master fa7e450 unverändert |
| Keine Secrets | ✓ |

STOP — Operator-Decision für nächste Phase (siehe Sequenz oben):

- **A:** GO OHLCV-CACHE-1 Plan-Review als nächstes
- **B:** GO TRAIL-EVENT-LOG-1 Plan-Review zuerst (kein OHLCV-Dependency)
- **C:** erst 24-72 h DATA-LINK-1-MONITOR + LABEL-1-MONITOR abwarten, dann A
